AB The present invention relates to water soluble 4-amino-2-butynyl or 4-(N-substituted amino)-2-butynyl esters (R1R2NCH2C.tplbond.CCH2O2R (I); variables defined below; e.g. 4-(morpholino)-2-butynyl acetate) and methods for production of said esters and the use of the esters for treatment of cancer. 4-Morpholino-2-butynyl acetate and 4-morpholino-2-butynyl pivalate show the highest antitumor activity amongst 8 examples of I and low toxicity to fibroblasts. For I: R is H, a straight-chained or branched, (un)saturated aliphatic radical with 1-20 C-atoms ((un)substituted ≥1 times by C1-C6-alkyl, C1-C6-alkoxy, halogen, epoxy, amino, mercapto, a Ph ring ((un)substituted ≥1 times by C1-C6-alkyl, C1-C6-alkoxy, hydroxy, epoxy, amino, mercapto or halogen)), a cycloalkyl group with 4 to 7 atoms ((un)substituted ≥1 times by C1-C6-alkyl, C1-C6-alkoxy, hydroxy, epoxy, amino, mercapto or halogen); R1 and R2 are joined to form a heterocyclic ring with 3 to 6 C-atoms, (un)substituted ≥1 times by C1-C6-alkyl, C1-C6-alkoxy, hydroxy, halogen, epoxy, amino, mercapto, whereby at least one C-atom can be replaced by O, S or N, or R1 and R2 = H, straight-chained or branched, (un)saturated aliphatic radical with 1-20 C-atoms, (un)substituted ≥1 times by C1-C6-alkyl, C1-C6-alkoxy, hydroxy, halogen, epoxy, amino, mercapto. Methods of prepn. are claimed and .apprx.10 example prepns. are included. For example, 4-(morpholino)-2-butynyl acetate was prepd. in 2 steps starting from propargyl alc. and acetic acid to give propargyl acetate, which underwent a Mannich condensation with paraformaldehyde and morpholine in the presence of CuCl.

ACCESSION NUMBER: 2005:561937 CAPLUS
DOCUMENT NUMBER: 143:221810
TITLE: Virtual Screen for Ligands of Orphan G Protein-Coupled Receptors
AUTHOR(S): Bock, Joel R.; Gough, David A.
CORPORATE SOURCE: Department of Bioengineering, University of California San Diego, La Jolla, CA, 92093-0412, USA
SOURCE: Journal of Chemical Information and Modeling (2005), 45(5), 1402-1414

LANGUAGE: English
AB This paper describes a virtual screening methodol. that generates a ranked list of high-binding small mol. ligands for orphan G protein-coupled receptors (oGPCRs), circumventing the requirement for receptor three-dimensional structure determination Features representing the receptor are based only on physicochem. properties of primary amino acid sequence, and ligand features use the two-dimensional atomic connection topol. and atomic properties. An exptl. screen comprised nearly 2 million hypothetical oGPCR-ligand complexes, from which it was observed that the top 1.96% predicted affinity scores corresponded to "highly active" ligands against orphan receptors. Results representing predicted high-scoring novel ligands for many oGPCRs are presented here. Validation of the method was carried out in several ways: (1) A random permutation of the structure-activity relation of the training data was carried out; by comparing test statistic values of the randomized and non-shuffled data, we conclude that the value obtained with non-shuffled data is unlikely to have been encountered by chance. (2) Biol. activities linked to the compds. with high cross-target binding affinity were analyzed using computed log-odds from a structure-based program. This information was correlated with literature citations where GPCR-related pathways or processes were linked to the bioactivity in question. (3) Anecdotal, out-of-sample predictions for nicotinic targets and known ligands were performed, with good accuracy in the low-to-high "active" binding range. (4) An out-of-sample consistency check using the com. antipsychotic drug olanzapine produced "active" to "highly-active" predicted affinities for all oGPCRs in our study, an observation that is consistent with documented findings of cross-target affinity of this compound for many different GPCRs. It is suggested that this virtual screening approach may be used in support of the functional characterization of oGPCRs by identifying potential cognate ligands. Ultimately, this approach may have implications for pharmaceutical therapies to modulate the activity of faulty or disease-related cellular signaling pathways. In addition to application to cell surface receptors, this approach is a generalized strategy for discovery of small mols. that may bind intracellular enzymes and involve protein-protein interactions.

AB The invention is a teachable system and method for predicting the interactions of proteins with other proteins, nucleic acids and small mols. A database containing protein sequences and information regarding protein interactions is used to "teach" the machine. Proteins with unknown interactions are compared by the machine to proteins in the database. Homologs of proteins known to interact in the database are predicted to interact. The invention is used for anal. of protein-protein interactions and protein-nucleic acid interactions, for prediction of protein epitopes, and for whole proteome interaction anal. Virtual screen for ligands of orphan G-protein coupled receptors is provided. The method of the invention can be used in drug design.

Thus, to a heated mixture containing 1,1-dimethyl-2-propynyl α-cyclohexyl-α-phenylglycolate, paraformaldehyde, and CuCl in dioxane was added Et2N to give 4-diethylamino-1,1-dimethyl-2-butynyl α-cyclohexyl-α-phenylglycolate (I), which was isolated as the HCl salt. I-HCl showed PA2 values for anticholinergic action and Ca2+ antagonism upon detrusor muscles of excised rabbit bladder of 7.33 and 6.72, resp.

AB Trans-4-amino-2-butene-1-ol esters, R2NCH2CH:CHCH2O2CR1, where R2N = Me2N or morpholino and R1 = Me or iso-Pr, were prepared by condensation of the desired amine with 4-chloro-2-butyn-1-ol, followed by LiAlH4 reduction and esterification. The corresponding cis isomers were prepared by esterification of the aminobutynol followed by catalytic reduction with H2 and Pd/C. None of these compds. (100mg/kg/week, 8 weeks) showed any hepatotoxicity in mice.

AB tert-Aminoalkynyl esters of 1-phenylcyclopentanecarboxylic acid, 1-phenyl-cyclohexanecarboxylic acid, and benzilic acid were more active than the esters of diphenylacetic acid and phenothiazine-10-carboxylic acid when tested for antagonist activity toward acetylcholine on isolated guinea pig ileum and for mydriatic activity in intact mice. Generally the esters of benzilic acid appeared to have the highest potency. The most effective of these compds. was about half as active as atropine in blocking the central effects of oxotremorine and its effect on contractions of the guinea pig ileum induced by acetylcholine was .apprx.14% that of atropine.

AB The title compds. exhibit tremorolytic action with a min. of side-effects, and thus are effective in therapy of Parkinson's disease. They are made preferably via the Mannich reaction, but alternative routes are possible. Thus, a mixture of 35 g. 1-phenyl-1-cyclopentanecarbonyl chloride (I) and 10 g. propargyl alc. was refluxed 15 min. and fractionated in vacuo to give propargyl 1-phenyl-1-cyclopentanecarboxylate (II), b0.3 107-8°. A solution of 10 g. II, 3.4 g. pyrrolidine, 1.6 g. (CH2O)n, and 0.15 g. CuCl in 30 cc. dioxane was refluxed 10 min., treated with 150 cc. H2O, extracted with Et2O (extract discarded), and alkalized with 5N NH4OH. The precipitated amino ester was taken up in Et2O, the solution dried, and the HCl salt precipitated with HCl in Et2O to give 4-pyrrolidino-2 - butynyl 1 - phenyl - 1 - cyclopentanecarboxylate (III).HCl, m. 105-7° (2:1 EtOH-Et2O). Similarly prepared were: 4-diethylamino-2-butynyl 1-phenyl-1-cyclopentanecarboxylate-HCl (IV), m. 93-4°; 4-diethylamino-2-butynyl 1-phenyl-1-cyclohexanecarboxylate-HCl, m. 126-8°; and 4-piperidino-2-butynyl 1-phenyl-1-cyclopentanecarboxylate-HCl, m. 124-6°. A solution of 11.5 g. I, 7 g. 4-diethylamino-2-butyn-1-ol (V), and 6 g. NEt3 in 75 cc. C6H6 was refluxed 2 hrs., cooled, and filtered, the filtrate worked up, and the product treated with HCl in Et2O to give IV. Similarly prepared were: 4-pyrrolidino-2-butynyl 1-phenyl-1-cyclohexanecarboxylate-HCl, m. 127-9°; 4-morpholino-2-butynyl 1-phenyl-1-cyclopentanecarboxylate-HCl, m. 123-5°. To 7 g. V were added 0.5 g. Na and 2.5 g. methyl 1-phenyl-1-cyclopentanecarboxylate (VI) and the mixture heated 3 hrs. at 50°/10 mm., thus removing MeOH as formed. After dilution with 100 cc. H2O and acidification to pH 5, unchanged VI was extracted with 50 cc. Et2O, the solution alkalized and extracted with Et2O, and IV isolated as above.

AB A group of aminobutynols (e.g. I. of the type R2NCH2C.tplbond.CCH2OH were prepared from propargyl alc. by the Mannich reaction, using CuSO4 as catalyst, and the probable course of reaction discussed. The effect of pH on the yield in the reaction was studied showing that the reaction should be run in a medium which is acidic enough to form and stabilize the postulated carbenium ion R2NCH2+ but not acidic enough to prevent the formation of Cu acetylide.

AB 4-Dialkyl(or 4-polymethylene)amino-2-butynols (I) were prepared from 4-chloro-2butynol and the corresponding secondary amines (Biel, et al., CA 52, 6335g). Four procedures were used for the preparation of the title esters RCO2CH2C.tplbond.CCH2R' (I): from propargyl alc. analogous to that of Jones (J., et al., CA 42, 8774e); by ester-alc. interchange from a Me ester and the appropriate 4-amino-2-butynol; by esterification of the aminobutynol with an acid chloride; and by ester-ester interchange from e.g. 4-diethylamino-2-butynyl acetate and the Me ester of an appropriate carboxylic acid. The compds. were tested for smooth muscle depressant, local anesthetic, and (or) anticholinergic actions. I.HCl (R = SMe, R' = piperidino) was found to have local anesthetic activity equivalent to lidocaine hydrochloride. I.HCl [R = ZPhCOH (Z = cyclohexyl), R' = NEt2] was found to possess about 10% of the activity of atropine on several types of extravascular smooth muscle plus strong papavarine-like action.

AB cf. CA 59, 8729h. The title compds. were prepared by the method of King and Holmes (CA 41, 5121g). Low yields are obtained by trans esterification of Me benzilate with the appropriate 4-dialkylamino-2-butyn-1-ol. The following Ph2CRCO2CH2C.tplbond.CCH2NR12 were prepared (R, R1, derivative, % yield, and m.p. given): Cl, Et, HCl salt, 81, 96-7°; HO, Et, HCl salt, 55, 127-8°, HO, Et, MeBr, 78, 149-50.5°; Cl, (NR12 =) pyrrolidino, HCl salt, 78, 164-5.5°; HO, (NR12 =) pyrrolidino, HCl salt, 86, 137-8° (base m. 110-12°); Cl, (NR12 =) piperidino, HCl salt, 76, 141-2°; HO, (NR12 =) piperidino, HCl salt, 52, 146-7°; HO, (NR12 =) morpholino, HCl salt, 50, 148-9°. The compds. had anticholinergic activity and inhibited tremors due to oxotremorine.

AB A solution of 1.56 g. paraformaldehyde (I) and 2.0 g. Me2NH in 10 ml. dry dioxane was allowed to stand at room temperature 10 min., 10 g. propargyl diphenylacetate in 25 ml. dry dioxane added, the mixture heated on a steam bath 17 hrs. under N and cooled slightly, the unreacted Me2NH removed, 2N HCl added, and the solution washed with Et2O, cooled with crushed ice, and made alkaline with 10% NaOH. The insol. oil was taken up in Et2O, the solution dried (MgSO4) and filtered, dry HCl passed into the solution, and the precipitate filtered off to give 4-dimethyl-2-butynyl diphenylacetate-HCl, m. 180-1.5° (decomposition) (PrOH). Similarly prepared was 4-pyrrolidino-2-butynyl diphenylacetate-HCl, m. 140-2° (EtOAc-PrOH). Diphenylacetyl chloride (15 g.) was slowly added to 10.0 g. 4-piperidino-2-butynol, bl.4 116°, n20D 1.5094 (prepared from 1-chloro-4-hydroxy-2-butyne and piperidine) dissolved in 30 ml. dry pyridine (exothermic reaction), the mixture heated on a steam bath 1 hr., cooled, and poured onto crushed ice-water, the mixture extracted with Et2O, the exts. washed with small portions 2N HCl to remove the residual pyridine, the Et2O solution washed with water and dried over MgSO4, and the product isolated by passing dry HCl into the filtered mixture to give 4-piperidino-2-butynyl diphenylacetate-HCl, m. 155-6.5° (EtOAc). To a solution of 17.2 g. α-chlorodiphenyl-acetyl chloride in 40 ml. dry pyridine was slowly added 7.0 g. 4-pyrrolidino-2-butynol (II), bl.0 98-104°, n20D 1.5055 (prepared from 1-chloro-4-hydroxy-2-butyne and pyrrolidine), and after the vigorous reaction subsided, the mixture poured onto crushed ice-water, the aqueous solution extracted with Et2O, the exts. washed with water and extracted with 2N HCl, and the acidic exts. heated on a steam bath 5 min., cooled, and made alkaline with 10% NaOH, the viscous oil taken up in Et2O, the Et2O solution dried (MgSO4) and filtered, and the Et2O evaporated to give a yellow solid, which was triturated with Et2O to give 4-pyrrolidino-2-butnyl benzilate, m. 108-11.5° (aqueous EtOH) (HCl salt m. 132.5-4.5°)'. Diphenylisobutyryl chloride (18.1 g.) and 21.0 g.

L4 ANSWER 28 OF 38 CAPLUS COPYRIGHT 2007 ACS on STN (Continued)
Et3N were cautiously mixed with 85 ml. anhyd C6H6, 10.1 g. II dissolved in 20 ml. anhyd. C6H6 added dropwise, the mixt. heated on a steam bath 3 hrs., and the product isolated as in the previous example to give 4-piperidino-2-butynyl diphenylisobutyrate-HCl, m. 156.5-8.5° (C6H6). To a soln. of 9.5 g. Me α-methylthiodiphenylacetate and 4.9 g. II in 150 ml. n-heptane was added about 50 mg. NaOMe, the mixt. stirred and refluxed, the MeOH-n-heptane azeotrope collected to a total of 0.85 ml. (addnl. NaOMe added during the distn.), the mixt. cooled and poured onto crushed ice-water, the org. layer sepd., washed with water, and extd. with 2N HCl, and the acidic exts. washed with Et2O and made alk. with 10% NaOH. The free base was taken up in Et2O, the soln. washed with water, dried (MgSO4), and filtered, and dry HCl passed in to give 5.4 g. 4-pyrrolidino-2-butynyl-α-methylthiodiphenylacetate-HCl, m. 154-6° (iso-PrOH). Similarly prepd. were (HCl salt m.p. given): 4-morpholino-2-butynyl benzilate, 158-60°; 4-diethylamino-2-butynyl-α-methylthiodiphenylacetate, 146-8° 4-piperidino-2-butynyl α-methylthiodiphenylacetate, 171.5-73°; 4-morpholino-2-butynyl α-methylthiodiphenylacetate, 171-3.5°; 4-diethylamino-2-butynylphenyl-α-thienylglycolate (81.5-3.5°), 4-diethylamino-2-butynyl phenylcyclohexylglycolate, 129-30°; 4-dimethylamino-2-butynyl benzilate, 130-3°; 4-diethylamino-2-butynyl benzilate, 128.5-30.5°; 4-piperidino-2-butynyl benzilate, 141.5-4°; 4-piperidino-2-butynyl α-methoxydiphenylacetate, 170.5-72°; and 4-piperidino-2-butynyl α-ethoxydiphenylacetate, 173.5-75°. A mixt. of 394.2 g. Me phenylcyclohexylglycolate and 293.1 g. 4-diethylamino-2-butynyl acetate was dissolved in 2.6 l. n-heptane by warming, the soln. heated with stirring to 60-70°, 8.0 g. NaOMe added, the temp. raised until the solvent distd., the distn. continued until no more MeOAc distd., the mixt. cooled to room temp., washed with water, and extd. with 165 ml. 2N HCl, the aq. exts. stirred to permit crystn. of the HCl salt, and crystn. completed by cooling to give 323 g. 4-diethylamino-2-butynyl phenylcyclohexylglycolate-HCl. A mixt. of 11.4 g. α-chlorodiphenylacetyl chloride and 4.9 g. 4-dimethylamino-2-butynol was heated 25 min. at 100-5°, then 30 min. at 70°, the oil washed thoroughly with anhyd. Et2O and dissolved in 100 ml. anhyd. EtOH, the soln. refluxed 25 hrs. with 5 g. Na2CO3, the mixt. cooled, filtered, and made basic with 10% NaOH, most of the EtOH removed in vacuo, the aq. mixt. extd. with Et2O, the exts. washed with water and dried over MgSO4, and then anhyd. HCl passed into the Et2O soln. to give 4.0 g. 4-dimethyl-2-butynyl α-ethoxydiphenylacetate-HCl, m. 166.5-8.5°.

AB Esters of diphenylacetic acid (I), 1-phenylcyclopentane-1-carboxylic acid (II), and phenothiazine-10-carboxylic acid (III) with RCH2C.tplbond.CCH2OH (IV) have been prepared, where R = NMe2 (V), NEt2 (VI), pyrrolidino (VII), piperidino (VIII), and morpholino (IX). IV was obtained from ClCH2C.tplbond.CCH2OH and the appropriate amine by the method of Biel (B., et al., CA 52, 6335g). Reported were IV (R, % yield, b.p./mm., and n22D given): VII, 85, 112-13°/0.9, 1.5092; VIII, 71, 101-2°/0.4, 1.5043. A solution of 0.055 mole acid chloride, 0.05 mole IV, and 0.06 mole Et3N in 50 ml. C6H6 was refluxed 3-20 hrs., then cooled, filtered, and concentrated in vacuo. The residue was dissolved in 50 ml. Et2O, treated with HCl and the precipitate recryst'd. from Et2O-EtOH. Quaternary salts of III esters were also prepared The following RCH2C.tplbond.CCH2R1R2X were obtained (RH, R1, R2X, % yield, and m.p. given): III, V, HCl, 48, 185-6° (decomposition); III, V, EtBr, 83, 158-9° (decomposition); III, VI, HCl, 61, 181-2° (decomposition); III, VI, MeBr, 91, 141-2° (decomposition); III, VII, HCl, 69, 155.5-6.5° (decomposition); III, VII, MeBr, 89, 163-4° (decomposition); III, VIII, HCl, 72, 176-7° (decomposition); III, VIII, MeBr, 98, 170-1° (decomposition); III, IX, HCl, 64, 188-9° (decomposition); II, V, HCl, 86, 144-6°; II, VI, HCl, 57, 92.5- 4°; II, VIII, HCl, 65, 124-6°; II, IX, HCl, 71, 167-9°; I, VI, HCl, 79, 128-30°; I, VII, HCl, 83, 142-4°; I, VIII, HCl, 78, 158-60°; I, IX, HCl, 80, 160-1.5°.

AB The ganglionic blocking activities of terpenes containing quaternary ammonium radicals were studied. Introduction of isoketopinic acid group to 2-morpholinoethanol-MeI was effective not only in the potentiation but in the prolongation of the ganglionic blocking action of the morpholinium compound Ketopinic acid derivs. demonstrated but a transient blocking action. They were destroyed by human serums and guinea pig liver homogenates. On the other hand, isoketopinic acid derivs. and π-oxocamphor oxime derivs. were not destroyed, and showed a marked prolonged effect.

AB The title compds. RN.(CH2)4.CHCO2(CH2)nC.tplbond.C(CH2)nNR1R2 (I) when quaternized are useful as anti-hypertensive and ganglion-blocking agents. Morpholine (87 g.) in 135 cc. benzene was treated dropwise with a solution of 41.8 g. 4-chloro-2-butyn-1-ol in 75 cc. benzene. After the exothermic reaction, the mixture was refluxed 3 hrs., cooled, filtered and distilled to give 90.8% 4-morpholino-2-butyn-1-ol (I), b0.01 104-6°. Me 2-(1-methylpiperidyl)carboxylate (31.4 g.), 31 g. I, and 0.5 g. NaOMe in 325 cc. heptane were heated and MeOH separated using a Dean-Stark tube to give 74.3% 4-morpholino-2-butynyl N-methylpipecolinate, b0.25 149-51° (short column); MeBr salt, m. 208-10°, yield 88.5%. Below are given other I prepared (R, NR1R2, % yield, b.p., n25D, and % yield and m.p. of the MeBr derivs. given): Me, NMe2, 70.2, b0.35 107-9°, 1.4824, 95.3, 193° (decomposition); Me, Et2N, 29.5, b0.5 133-5°, 1.4824, 60.4, 204-5° (decomposition); Me, pyrrolidino, 70.3, b0.55 138-9°, 1.4972, 98, 205° (decomposition); Me, morpholino, 74.3, b0.25 149-51°, 1.5012, 88.5, 208-10° (decomposition).

AB AcO2H (0.51 mole) as a 40% aqueous solution was added over 15 min. to 1 mole 2-chloropyridine (I) at 70°, the mixture stirred 150 min. at 70°, neutralized with NaOH, and the unreacted I distilled at about 115° with H2O. The distillate separated into 2 phases; 0.61 mole I was recovered by decantation, to leave a residue of 0.39 mole 2-chloropyridine 1-oxide (100 and 77% yields, based on I and AcO2H, resp.). The recovered I was recycled.

GI For diagram(s), see printed CA Issue.
AB Gossypol (I) anils were prepared from a series of aliphatic and aromatic amines to study the scope of the reaction and to prepare derivs. of I to be used as (a) intermediates, (b) physiol. active compds., (c) dyes, or (d) model compds. for complexes of I with proteins. In group (a) were allylamine, diethylenetriamine, n-C18H37NH2, aminoacetal, p-H2NC6H4Ac, p-nitrobenzylamine, and p-BrC6H4CH2NH2, in group (b) H2NCH2CH2NMe2, p-H2NC6H4CO2Bu, p-H2NC6H4SO2NH2, and H2NCH2CH2Ph, in group (c) 4-(o-tolylazo)-o-toluidine and p-H2NC6H4N:NPh, and in group (d) H2NCH2CO2Me, DL-lysine Me ester, and H2NCH2CONHCH2CO2Me. Deapogossypol hexa-Me ether was demethylated with C5H5N.HCl to deapogossypol, which was converted to the hexaacetate, deapogossypolone tetraacetate, and deapohydrogossypolone octaacetate. Anhydrogossypol was treated with cyclopentadiene to give a crystalline product of proposed structure II. Apogossypol was converted to the hexaallyl ether, which was heated in a mixture of Me2NPh and Ac2O to give the tetraacetate of a partly rearranged product. I was oxidized in 10% aqueous NaOH with 30% aqueous H2O2 at 60-70° 8 min. to yield 2 crystalline compds., m. 231-3°, not further examined, and, m. 184-6°, tentatively identified by infrared and C-H analysis as 2,2'-dihydroxy-4,4'-diisobutyl-6,6'-dimethyl-biphenyl-3,3'-dicarboxylic acid (III); bis(2,4-dinitrophenyl hydrazide) m. 269-70°. Ac2O with III gave a diacetate. A possible mechanism for the formation of III was given.

AB cf. CA 54, 22614i. The structure of β-(2-hydroxy-4-toluoyl)propionic acid (I), previously assumed on the basis of incomplete evidence (cf. Raval, et al., CA 33, 3779), was confirmed on the basis of the following reactions. I (5 g.) boiled 12 hrs. with 12 g. Me2SO4, 30 g. anhydrous K2CO3, and 15 ml. acetone gave 83% methyl β-(2-methoxy-4-toluoyl)propionate (II), m. 65-6° (C6H6-petr. ether). II (5.1 g.) boiled 2 hrs. with 3% alc. KOH gave 4.4 g. β-(2-methoxy-4-toluoyl)propionic acid (III), m. 127-8° (C6H6). III (1 g.), 40 ml. 3% KOH, and 3 g. KMnO4 heated 1 hr. on a boiling H2O-bath gave 0.6 g. 2-methoxyterephthalic acid. III (2 g.) reduced by the Martin modified Clemmensen method (30 hrs. at reflux) gave 1.8 g. γ-(2-methoxy-4-tolyl)butyric acid (IV), m. 54-5° (petr. ether). IV (1 g.) refluxed 2 hrs. with 0.5 ml. POCl3 in 10 ml. tetrachloroethane, and the mixture hydrolyzed with cold H2O and then steam-distilled gave 5-methoxy-7-methyl-1-tetralone; 2,4-dinitrophenylhydrazone, m. 223-4° (HOAc).

TITLE: Initiators and peroxide products of the liquid phase autoxidation of 3-carene
AUTHOR(S): Erofeev, B. V.; Chirko, A. I.
SOURCE: Uchenye Zapiski, Belorus. Gosudarst Univ. im. V. I. Lenina, Ser. Khim. (1956), 29, 15-22
DOCUMENT TYPE: Journal
LANGUAGE: Unavailable
AB The primary product of the autoxidn. of 3-carene (I) was I hydroperoxide (II). On reduction, II gave carenol. The other product of the autoxidn. was 2,2'-peroxide (III) of I. The following initiators were investigated: MnO, MnO2, Mn(HCO2)2 (IV), Mn(OAc)2 (V), Mn butyrate (VI), Mn stearate (VII), Fe2O3, Co3O4, (HCO2)2Co (VIII), Co(OAc)2 (IX), Co butyrate (X), Co stearate (XI), Co oxalate (XII), MoO3, WO3, PbO2, the hydrate of lead oxide (XIII), Pb(OAc)2 (XIV), SeO2, kaolin (XV), and montmorillonite (XVI). The best initiators were: MnO2, Fe2O3, Co3O4, MoO3, WO3, PbO2, XV, XVI. Weak initiators were XII, XIII, and XIV. SeO2 had an inhibiting effect. In the case of MnO, IV, VIII, XII, WO3, XIII, XIV, XV, or XVI, the amount of II found among the products of the autoxidn. approached the % autoxidn.; in the case of strong initiator, the amount of II was smaller. I (35 g.) was oxidized in the presence of 1% XIV as long as the velocity of the oxidation began to decrease (4 l. O was necessary). The unchanged I was distilled and the residue fractionated 3 times in vacuo to give 8.5 g. II, b0.024 49-50°, d20 1.0117, n20D 1.4991, MR 48.79, did not react with 2,4-dinitrophenylhydrazine, reacted violently with Pb(OAc)4 (XVII). The distillation residue of II contained III, b0.06 100°, d20 1.0717, n20D 1.5150, n50D 1.5050, gave no reaction with XVII. On reduction by KI in AcOH II yielded carenol, b0.6 65-6°, d20 0.9892, n20D 1.4957, reacted with Na; phenylurethan m. 121°.

AB cf. C.A. 50, 2579d. Morpholine (87.0 g.) in 135 cc. C6H6 treated rapidly dropwise with 41.8 g. ClCH2C.tplbond.CCH2OH in 75 cc. C6H6, refluxed 3 hrs., cooled, and filtered, the residue washed with C6H6, and the combined filtrates distilled yielded 56.3 g. 4-morpholino-2-butyn-1-ol (I), viscous oil, b0.1 104-6°, n25D 1.5087. Me N-methylpipecolinate (31.4 g.) and 31.0 g. I in 325 cc. heptane refluxed with 0.5 g. NaOMe under a Dean-Stark trap in which the liberated MeOH sepd. from the heptane (2 addnl. 0.3-g. portions NaOMe may be required to complete the reaction), 50% of the heptane distilled, and the residue chilled, filtered, and distilled gave 41.6 g. 4-morpholino-2-butynyl N-methylpipecolinate (II), b0.25 149-51°, n25D 1.5012. II (14.0 g.) in 80 cc. iso-PrOH refluxed 3 hrs. with 19.0 g. MeBr, cooled, and filtered yielded 20.8 g. II.2MeI, m. 208-10° (decomposition) (hot EtOH). Similarly were prepared the following aminoalkyl esters of 1-methylnipecotic acid (aminoalkyl group, b.p./mm. of ester, and m.p. of dimethobromide given): Me2N(CH2)2, 103-5°/4.0, 230-2°; Me2N(CH2)3, 106-9°/1.0, 238-9°; 2-morpholinoethyl, 116-20°/1.0, 235-6°; 2-pyrrolidinoethyl, 103-5°/1.0, 209-11°; o-ClC6H4CH2MeN(CH2)2, 148-53°/0.15, - (dimethiodide, 178-9°); 2-diethylaminoethyl 1-ethylnipecotinate, 104-6°/2.0, 221-2°. 3-Dimethylamino-2-propyl 1-methylnipecotinate, 137-41°/17, 255-7°; 2-dimethylaminoethyl isonipecotinate, 95-6°/1.0, 276-7°. The following aminoalkyl esters of 1-methylpipecolinic acid (same data given): Me2N(CH2)2, 145-7°/23,245°; Me2N(CH2)3, 156-8°/23, - (dimethiodide, 224-6°); 2-morpholinoethyl, 136-8°/1.2, 233-5°; o-ClC6H4CH2MeN(CH2)2, 100-5°/0.5, - (dimethiodide, 185°); 3-morpholinopropyl, 140-2°/0.8, - (dimethiodide, 169-71°). 2-Dimethylaminoethyl nicotinate, 154-6°/19, 218-19°. The following 1,x-MeC5H9N(CH2)mO2C(CH2)nNR2 (III) (ring position, m, n, NR2, b.p./mm. of ester, and m.p. of dimethobromide or in parentheses of dimethiodide given): 2, 1, 2, morpholino, 140-1°/0.8, 188-9°; 3, 0, 2, pyrrolidino, 105-8°/0.3, (165-6°); 3, 0, 2, morpholino, 126-9°/0.7, (182-3°); 3, 0, 1, NMe2, 136-8°/16, 183-4°; 3, 0, 2, Me2N, 158-60°/37, (194-5°); 3, 1, 1, Me2N, 147-8°/22, 232-3°; 4, 0, 1, Me2N, 110-13°/8, 263-4°; 3, 0, 2, o-ClC6H4CH2MeN, -, (125°). 3-(N-o-Chlorobenzylpiperidyl)3-morpholinopropionate (IV), 178-88°/0.05, 88°;

L4 ANSWER 38 OF 38 CAPLUS COPYRIGHT 2007 ACS on STN (Continued)
3-pyrrolidinopropionate analog of IV, 169-72°/0.05, 82-4°. The following analogs of II (b.p./mm., n25D of ester, and m.p. of dimethobromide given): Me2N, 107-9°/0.35, 1.4824, 193°; Et2N, 133-5°/0.50, 1.4824, 204-5°; pyrrolidino, 138-9°/0.55, 1.4972, 205°. The % lowering of blood pressure with 1.0 mg./kg. intravenously and 10 mg./kg. orally in the normotensive dog and the duration of the effect are tabulated for the various bisquaternary compds. Several of the compds. displayed potent and sustained hypotensive properties. The structural features necessary for optimum hypotensive activity are discussed.
